Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Contact: sequence_submissions@genome.wi.mit.edu

On Jan 15, 2002 This sequence version replaced gi:18121468.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the

variation amortation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with corresponding to the overlapping clone, as we submit sequences with this sequence was finished as follows unless otherwise noted: all regions were either double stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) = 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one MI3 subclone; and the assembly was confirmed by restriction digest. The following absendations are used to associate primary accession numbers given in the feature table with their source databases: Em., EMBJ; Sw., SWISSPROT; Tr., TREMBL; WP., MORMPEPP, Information on the WORMPEPP that was not the workers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               IMPORTANT: This sequence is not the entire insert of clone RP11-21787 it may be shorter because we sequence overlapping sections only once, except for a short overlap.

The true right end of clone RP11-21737 is at 96717 in this sequence. The true left end of clone RP11-127810 is at 72980 in this sequence. The true right end of clone RP11-31320 is at 2000 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           http://www.sarger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NOTE: This is a 'working draft' sequence. It currently consists of 39 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chemistry: Dye-terminator Big Dye; 1004 of reads Assembly program: Phrap: version 0.960731 consensus quality: 11751 bases at least Q40 consensus quality: 145749 bases at least Q40 consensus quality: 145749 bases at least Q20 consensus quality: 160940 bases at least Q20 consensus quality: 160940 bases at least Q20 consensus quality: 160940 bases at least Q20 consert size: 185000; aqarose-fp ceality coverage: 2.9 in Q20 bases; agarose-fp quality coverage: 3.2 in Q20 bases; sum-of-contigs

                                                                                                                                                                              * sequencing reads that have not been assembled into 
* contigs. Runs of N are used to separate the reads 
* and the order in which they appear is completely 
* arbitrary. Low-pass sequence sampling is useful for 
* identifying clones that may be gene-rich and allows 
* overlap relationships among clones to be deduced 
* However, it should not be assemmed that this clone 
* will be sequenced to completion. In the event that 
* the record is updated, the accession number will 
* be preserved.
